

ASX Announcement

7 April 2016

Significant Gold Anomaly Identified at 100% owned Davies Bore Gold Prospect

HIGHLIGHTS

- 1km long significant gold anomaly identified 3km from Regis Resources' Rosemont Mine
- Davis Bore prospect is on Duketon's 100% owned Kulguddi Project (Figures 1 & 2)
- Inclined aircore drilling down to a maximum of 125 metres returned intersections including;
 - **12m @ 0.9g/t from 97m**, including **3m @ 2.7g/t from 100m**
 - **25m @ 0.7g/t from 100m**, including **9m @ 1.6g/t from 116m**
 - **6m @ 0.7g/t from 70m**, including **3m @ 1.1g/t from 73m**
- Anomaly is open to the north and south and supported laterally
- Minor historic drilling in the area
- Follow-up drilling to commence in May 2016

Duketon Mining Limited (ASX: DKM) is pleased to announce that aircore drilling at the 100% owned Davies Bore prospect (within the Kulguddi Project) has identified a significant gold anomaly. The anomaly is over 1km long and identified across 3 aircore lines spaced approximately 500m apart. Intersections include **12m @ 0.9g/t** including 3m @ 2.7g/t from 97m, **25m @ 0.7g/t** including 9m @ 1.6g/t from 100m and **6m @ 0.7g/t** including 3m @ 1.1g/t from 70m. The anomaly is open to the northwest and southeast. Although there are historical shallow drilling in the area it is considered to be broadly ineffective.

The Davies Bore Prospect is located 3km west of Regis Resources Ltd (ASX: RRL) owned Rosemont Mine and approximately 5km north west of King John Resource (RRL) (Figure 1 & 2) .

The rocks are interpreted to be part of a package of felsic to mafic meta-volcanics and meta-sediments. The depth of weathering present at Davies Bore may indicate the presence of a major structure ideal for providing a pathway for gold mineralising fluids to have permeated the rock package and deposited precious metals. Significant shearing, alteration (including sulphides) and quartz veining is associated with the best of the intervals in hole DMAC029 **25m @ 0.7g/t** including **9m @ 1.6g/t**.

Duketon's Managing Director, Stuart Fogarty, said:

"This is a significant anomaly considering the footprint so far, the thicknesses and grades in a number of the holes, and the fact that it is open to both the north-west and the south-east."

"This is early days at this largely untested prospect. However we are excited about the next round of aircore drilling to delineate the anomaly and then follow up with some RC or diamond drilling with the aim of potentially uncovering valuable gold mineralisation."

Follow-up drilling will commence in May 2016 and will include;

- Aircore drilling to infill and extend the anomaly, and;
- Follow-up RC and/or diamond drilling to test basement targets

The information in this report that relates to exploration results is based on information compiled by Mr Brad Drabsch, Member of the Australian Institute of Geoscientists ("AIG") and an employee for Duketon Mining Limited. Mr Drabsch has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity that is being undertaken to qualify as a competent person as defined in the JORC Code 2012. Mr Drabsch consents to the inclusion in the report of the matters based on the information in the form and context in which it appears.

JORC Code, 2012 Edition – Table 1 report – Duketon Project

Section 1 Sampling Techniques and Data – Davies Bore AC Drilling

(Criteria in this section apply to all succeeding sections.)

| Criteria | JORC Code explanation | Commentary |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sampling techniques | <ul style="list-style-type: none"> Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. In cases where ‘industry standard’ work has been done this would be relatively simple (eg ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information. | <ul style="list-style-type: none"> Aircore (AC) drill chips were collected as composite samples (either 1m, 2m, 3m or 4m samples) from bulk piles laid out next to the drillhole collar using a hand held scoop. Samples were scooped in such a manner as to ensure portions of the whole pile were sampled. This is standard industry practice for this type of early phase drilling. Mineralisation determined qualitatively by geological logging and quantitatively through assaying. Approximately 2kg of sample was collected as a composite. This sample was pulverised to 85% passing 75µm then a 10g sub-sample digested via aqua-regia followed with assay by ICP-OES or ICP-MS methods. |
| Drilling techniques | <ul style="list-style-type: none"> Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc). | <ul style="list-style-type: none"> AC drilling using a face sampling blade or where AC hammer method used, a face sampling bit. |
| Drill sample recovery | <ul style="list-style-type: none"> Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximise sample recovery and ensure representative nature of the samples. | <ul style="list-style-type: none"> Recoveries qualitatively noted at the time of drilling and recorded in the DKM database. The cyclone of the drill rig is cleaned at the end of each 3m rod to ensure sample is not “hung-up” and samples are as clean as possible |

| Criteria | JORC Code explanation | Commentary |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | <ul style="list-style-type: none"> Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. | <ul style="list-style-type: none"> with as little cross contamination as possible. No relationship between grade and recovery has yet been established. |
| Logging | <ul style="list-style-type: none"> Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. The total length and percentage of the relevant intersections logged. | <ul style="list-style-type: none"> All samples were logged to a level of detail to support future use in a mineral resource calculation should it be required. Qualitative: Lithology, alteration, mineralisation. Quantitative: Vein percentage, assaying for gold and other elements. All holes for their entire length are logged. |
| Sub-sampling techniques and sample preparation | <ul style="list-style-type: none"> If core, whether cut or sawn and whether quarter, half or all core taken. If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. For all sample types, the nature, quality and appropriateness of the sample preparation technique. Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling. Whether sample sizes are appropriate to the grain size of the material being sampled. | <ul style="list-style-type: none"> Aircore (AC) drill chips were collected as 1m, 2m 3m or 4m composite samples from bulk piles laid out next to the drillhole collar using a hand held scoop. Sample condition with respect to moisture content is noted on the geological log. The entire composite sample (approx. 2kg) has been dried, pulverised to 85% passing 75µm, a 10g sub-sample split then digested by aqua-regia followed by assay with ICP-MS or ICP-OES for gold and a suite of pathfinder elements. No field duplicates have been processed as yet. Pulp duplicates have been taken at the pulverising stage and selective repeats conducted at the laboratories discretion. Sample sizes are considered appropriate for the grainsize of the material sampled. |
| Quality of assay data and laboratory tests | <ul style="list-style-type: none"> The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels | <ul style="list-style-type: none"> Samples were assayed using an ICP-MS or ICP-OES finish after being digested with aqua-regia (industry standard technique for low level Au in surface samples). This is considered a partial digest technique however in weathered samples it is considered to approximate a total digest assay. Assays were returned for the following elements: Au, Ag, As, Cu, Pb, Zn, Ni, Sb, Bi, W, Te, Mo, Pt and Pd. Certified Reference Material (Standards) was submitted with batches (approximately 1 in every 25 samples) and laboratory inserted |
